# Hands-on Lab: Automating MySQL Database Tasks Using Shell Scripts

and line interface (CLI) to automatically back up the database and restore the database when required

### Software Used in This Lab

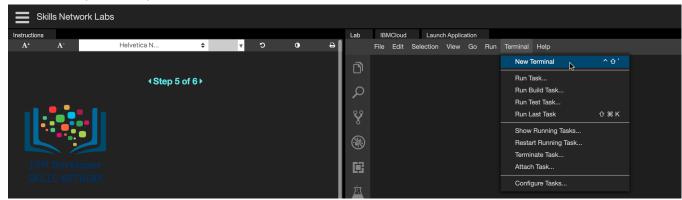

ete this lab, you will use the MySQL relational database service available as part of the IBM Skills Network Labs (SN Labs). SN Labs is a virtual lab environment used in this course

- Create the shell script to back up the database.
   Create a cron job to run the backup script thereby creating a backup file.
   Truncate the tables in the database.
   Restore the database using the backup file.

# Exercise

### Task A: Create a Database

1. Go to **Terminal > New Terminal** to open a terminal from the side-by-side launched Cloud IDE.

1. 1 1. start\_mysql Copied!

```
MySQL database started, waiting for all services to be ready....
Your MySQL database is now ready to use and available with username: root password: MTY5MTUtc2FuZGlw
You can access your MySQL database via:
• The browser at: https://sandipsahajo-8080.theiadocker-27.proxy.cognitiveclass.ai
• Commandline: mysql —-host=127.0.0.1 —-port=3306 —-user=root —-password=MTYSMTUtc2Fu2G
```

1. Add the password you noted in the previous step to the .my. cof file. This aids in not entering the password over and over again and keeps the password hidden in the config file. Note:Once you open the -/.my.cnf file enter the line password = <Your MySQL Passwords and replace the password with your password noted before.

[mysqlimport] host = 127.0.0.1 port = 3306 user = root password = <Your M [mysqlshow] .host = 127.0.0.1 .port = 3306 .user = root .password = <Your M 30. 31. [mysqladmin] 32. host = 127.0.0.1 33. port = 3306 34. user = root 35. password = «Your MySQL Pi 1. Press Ctrl+O followed by the Enter key to save the file. 3. Initiate the mysql command prompt session within the MySQL service session using the command below in the terminal:

Here you find that you are able to login to mysql without entering the password as it is already configured in the -/.my.cnf file.

1. Create a new database sakila using the command below in the terminal and proceed to Task B:

7/11/22, 16:12 1 of 5

1. To use the newly created empty sakila database, use the command below in the terminal:

```
mysql> use sakila;
Database changed
```

1. Restore the sakila mysql dump file (containing the sakila database table definitions and data) to the newly created empty sakila database using the command below in the terminal

1. To check, list all the table names from the sakila database using the command below in the terminal

```
    1. 1
    SHOW FULL TABLES WHERE table_type = 'BASE TABLE';
    Copied!
```

```
mysql> SHOW FULL TABLES WHERE table_type = 'BASE TABLE';
     Tables_in_sakila | Table_type |
    actor address category city country customer film category inventory language payment rental staff store
                                                       BASE TABLE
15 rows in set (0.00 sec)
mysql>
```

## Task C: Understanding the Process Involved in Creating MySQL Database Backups

You will create a shell script that does the following

- $\bullet$  Writes the database to an sqlfile created with a timestamp, using the  $\ensuremath{\mathsf{wysqldump}}$  command
- Zips the sqlfile into a zip file using the grip co
- Removes the sqlfile using rm con

Deletes the backup after 30 days

Before you create the script, let's understand each of the command blocks you will be adding to the file.

- To start with, you have a database that you want to back up. You will store the name of the database in a variable.

It is always a good practice to print some logs, which can help in debugging.

- 1. 1
   1. echo "Pulling Database: This may take a few minutes"
- Copied!

- You will decide and set the number of days the backup will need to be kept.

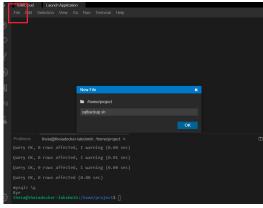

- 1. 1 1. keep\_day=30 Copied!
- 1. sqlfile=\$backupfolder/all-database-\$(date +hd-hm-hY hH-hM-hS).sql 2. zipfile=\$backupfolder/all-database-\$(date +hd-hm-hY-hH-hM-hS).gz

```
f symidous dMINDAGE , swifile ; then
sche 'Eql desp creates'
c compress because
if size - Saqifile > Sizifile; then
sche 'The backup ass successfully compressed'
sche 'The backup ass successfully compressed'
acho 'Error compressing backupBackup was not created'
exit
rm SsqtTile
else
echo 'pg_dump return non-zero code No backup was created!'
exit
```

Now that you have examined the components and understood what the shell script does, let's create a file and save the script in it.

# Task D: Creating a Shell Script for MySQL Database Backups

1. Select File menu and then select New File to create a new shell script named solbackur

7/11/22, 16:12 2 of 5

```
1. #!/bin/sh
2. # The above line tells the interpreter this code needs to be run as a shell script.
4. # Set the database name to a variable.
5. DATABASE-sabila'
            # This will be printed on to the screen. In the case of cron job, it will be printed to the logs. echo "Pulling Database: This may take a few minutes"
             # Set the folder where the database backup will be stored backupfolder=/home/theia/backups
             # Number of days to store the backup
keep_day=30
             sqlfile=$backupfolder/all-database-$(date +hd-hm-NY hH-NM-NS).sql
zipfile=$backupfolder/all-database-$(date +hd-hm-NY_hH-NM-NS).gz
             -create a backup
in eyeldomp obatimatic
in the "Sql demp Created"
of Compress bought of Stipfile; then
if giz] -c Sql[file > Szipfile; then
cleek" by backup one successfully compressed'
elsek" by backup one successfully compressed'
cleek" firer compressing backupflackup was not created.
             else cho 'pg_dump return non-zero code No backup was created! exit
    35.
36. # Delete old backups
37. find sbackupfolder -mtime +$keep_day -delete
     1. Save your script using the Save option or pressing Commands+S (in Mac) or Ctrl+S (Windows).
     2. Now you need to give executable permission for the shell script file, to the owner (yourself), by running the following command in the terminal. * stands for user or creator, * stands for execute, and * stands for read permission for the shell script file, to the owner (yourself), by running the following command in the terminal. * stands for user or creator, * stands for execute, and * stands for read permission for the shell script file, to the owner (yourself), by running the following command in the terminal. * stands for user or creator, * stands for execute, and * stands for read permission for the shell script file, to the owner (yourself), by running the following command in the terminal. * stands for user or creator, * stands for execute, and * stand
 Copied!

    Cron is a system that helps Linux users schedule any task. It can be a shell script or a simple bash command.

    A cron job helps us automate our routine tasks and it can be hourly, daily, monthly, etc.
    A crontab (cron table) is a text file that specifies the schedule of cron jobs.

        • Each line in the crontab file contains six fields separated by a space followed by the command to be run
 The first five fields may contain one or more values separated by a comma or a range of values separated by a hyphen.

*The asterisk operator means any value or always. If you have the asterisk symbol in the Hour field, it means the task will be performed each h
The comman operator allows you to specify a last of values for repetition. For example, if you have 1.5 in the Hour field, the teaks will run at 1 a.m. 3 a.m. and 5 a.m.

The hyphen operator allows you to specify a range of values. If you have 1.5 in the Hour field, the teaks will run every weekday (from Monday to Friday).

The slash operator allows you to specify a range of values. If you have 1.5 in the Hour field, the teaks will run every weekday (from Monday to Friday).

The slash operator allows you to specify as the stat will be repeated over a certain interval between them. For example, if you have 44 in the Hour field, it means the action will be performed every four hours. It is same as specifying 0,4,8,12,16,20. Instead of an asterisk hefore the slash operator, you can also use a range of values. For example, 130(1) means the same as 1,11,21.
                                and how a crontab works, let's set up a cron job that happens every 2 minutes
      1. To start the crontab, run the following command in the terminal:
 1. 1
1. crontab -e
Copiedi
 This will open a crontab editor as follows
      Read 72 lines

Get Help TO Write Out Th Where Is 18 Cut Text A J Justify To Cur Pos Tal Undo

X Exit AR Read File A Replace Unut Text A To Spell Go To Line Red Redo
      1. Scroll to the bottom of the editor page using the down arrow key and copy and paste the following code

    Press Ctrl+O followed by the Enter key to save the file.

 Note 23 lines | Note 23 lines | Note 23 lines | Note 24 lines
 Copied!
        1. After 2 minutes, execute the following command to check whether the backup file are created
             theia@theiadocker_lakshmin:/Sactupb5_15 -1
total 1272
-rw-rw-r- 1 theia theia 627833 Oct 7 01:10 all-database-07-10-2021_01-08-01.gz
-rw-rw-r- 1 theia theia 627833 Oct 7 01:10 all-database-07-10-2021_01-10-01.gz
theia@theiadocker-lakshmin:/backups$ []
          In a real-life scenario, the cron service is a long-running service that runs in the background. To stop the cron job you can run sudo service cron stop
 Practice Exercise

    Change the crontab schedule to create a backup every week on Monday at 12:00 a.m.
    Click here for solution
    Change the crontab schedule to create a backup every day at 6:00 a.m.
    Click here for solution
 Task F: Truncate the Tables in the Database
 Now that you have automated the backup task, let's replicate a scenario where the data is corrupted or lost and you will remove all the data in the database and restore the data from the backup
 We will create a truncate script that does the followin

• Connects to mysql RDBMS using the credentials.

    Lists tables using show tables and feeds the output using pipe(|) operator to the next co
```

3 of 5 7/11/22, 16:12

```
1. Copy this script and paste it in the new file.
   3. DEFANCEMENTS

5. mysel, "Rise 'thou tables' sailla | \
5. mysel, "Rise 'thou tables' sailla | \
6. bails read table; do mysel, "Rise 'thou tables; do mysel, "Rise 'thou table 'tables; do mysel, "Rise 'thou table 'table; SET FOREIGN KEY CHECKS-1;" ; done

-e "use sailla; SET FOREIGN KEY CHECKS-0; truncate table stable; SET FOREIGN KEY CHECKS-1;" ; done
    1. Change the permission of the file by running the following command:
    1. 1
1. sudo chmod u+x+r truncate.sh
 Copied!
     1. To check whether the tables in the database are truncated, log in to the database with the credentials
1. 1
1. mysql
Copied!
   Server version: 8.0.22 MySQL Community Server - GPL

    Switch to the sakila database.

 Copied!
 mysol> use sakila
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A
1. 1
1. show tables;
Copiedi
      1. Retrieve all the rows from staff table. If the truncate was successful, the output should be an Empty set.
    1. 1
1. select * from staff;
      1. Quit the mysql prompt
       mysql> \q
Bye
theia@theiadocker-sandipsahajo:/home/project$ ■
 Task G: Restore the Database
 To restore the database:

• You pick up a compressed zip file present in the backup folder and unzip it to extract the sql file using the gunzip comm.

    You connect to the mysql database and restore the database with the sqlfile.

      1. In the terminal window, run the following command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to find the list of backup files that have been created as the command to file the command t
    1. Select the file that you want to restore the data from and copy the file name.
    2. Unzip the file and extract the SQL file from the backup file.
Once the command is executed, you will be prompted to enter your mysql login password. Paste the password that you have copied before using Ctrl+V and press Enter
     1. Use the sakila database:
1. 1
1. use sakila;
Copiedi
     1. Select all the rows from any one of the tables, as given below. You should find that the database is restored.
     1. 1
1. select * from staff;
   Copied!
Practice Exercise
► Click here for the solution
    1. Write a shell script which takes the database name and the script file as parameters and restores the database from the sql file
Optional Exercise
     1. You can clean up the backups folder by using the following com
1. 1
1. sudo rm -rfv /home/theia/backups
Copied
